Vaccine targets umors

The treatment being studied at the University of Miami is given after a patient is already diagnosed, not before like a polio or flu shot.

By FRED TASKER

McClatchy-Tribune News Service

MIAMI — When U.S. Sen. Edward Kennedy was diagnosed with a glioblastoma of the brain in May 2009, doctors understood there was little chance he could survive it. He died that August.

"That's a malignant tumor. The current five-year survival rate is 1 percent," said Ricardo Komotar, a neurooncologist at Sylvester Comprehensive Cancer Center.

But cancer specialists from the University of Miami Medical School and nine other U.S. institutions are well into clinical experiments aimed at ending the tumor's fatal reputation.

"We're not going to cure it," said Komotar, who is also director of surgical neurooncology at University of Miami Hospital. "Our goal is to convert it into a chronic condition like high blood pressure or diabetes that you can live the rest of your life with and live a very normal life."

Their weapon: a brain cancer vaccine. It's not a preventive vaccine like a flu or polio shot, given to ward off disease. Instead, it's a "therapeutic" vaccine given after the patient already has the tumor. It's still called a vaccine because, unlike most cancer medicines, it doesn't attack the disease directly. Instead, it marshals the body's immune system to attack it.

JOIN THE STUDY

The University of Miami has begun recruiting volunteers for the study. A patient must have been diagnosed by MRI with a glioblastoma, but must not have started surgery, chemotherapy or radiation. That's because study surgeons must remove an intact tumor to use in creating the vaccine. To volunteer, call Dr. Ricardo Komotar at 305-689-2427 or rkomotar@med.miami.edu.

Research: Better managing blood sugar might stave off dementia

Scientists say treating diabetes and risk factors linked to it now could help prevent dementia cases later in life.
