

For the Electrolux Design Lab competition, I wanted to create the pinnacle dining experience for 2050. In the future, families and friends will be spread out farther than ever, and so social networking will increase in popularity. The Ventrilo table reinvents current views of projection technology, and creates a multi table system, one that can be shared between multiple users, and in multiple “enhanced” environments.

Ventrilo

By placing the projections in the corner, an entire environment is opened up to the user, rather than a simple two dimensional plane. If the user chooses to eat alone, they can use the table for more immersive video watching. With two users, the table splits in half, projecting a realtime environment to eat by. Of course, when four users connect together, the table becomes complete, creating the optimal dining experience.
