

Medical University of South Carolina
Children's Emergency Room

Designed to distract kids.

This project was a low budget emergency department renovation in the coastal town of Charleston, South Carolina. The goal was to provide a functional space for the staff while also providing the young patients with an engaging distraction.

The design inspiration is based on child friendly aquatic life. The entire space, from signage to furniture was designed around the theme. The signage and graphics are divided into four themes that alternate by exam room. To distract the young patients, each exam room contains a "porthole" photo of an aquatic animal and a corresponding "fun fact".

Designed while employed by Stanley Beaman & Sears.
