

SALVÉ BAGEL TOASTER

2011 Electrolux Design Lab Finalist

The Salvé bagel toaster is a unique product that allows the user to toast bagels on the run. Upon sensing a bagel on its turntable, Salvé begins rotating and toasting the bagel using its 'sugar-fueled battery' powered heating element. When the desired darkness level is reached, the user simply removes the freshly toasted bagel. By focusing the heat of one element onto the bagel, Salvé proves to be more energy efficient than conventional toasters, which use multiple elements, and waste energy heating surrounding space. Salvé is easily recharged using induction on its ceramic charging dock.
