

01.6 CIRCULAR

SECTION

These images show how circular is constructed.

1. In this image it is showed the joint between the arm and the post. The arm has already holes and ready to be screwed. However the post has to remain flat until it is chosen where the traffic light will be located.

2. The joint between the arm and the back lid has a polygonal form with twelve faces. Thus it is easy to choose the advisable inclination for each place. Inside of the back lid there is a tap with which we fix the rear lid to the arm.

3. Finally with that third detail we appreciate how the back lid and the front lid are anchored between them, and also how the leds' plate is fixed. Everything is made in a way that can be removed if it needs so.
