

Developing the next generation of wireless conferencing for Revolabs required equal measures of **creative problem solving** and coordinated team effort. Beginning with a form language developed to convey a "boardroom ready" image, the line employs sleek, contemporary geometries and material finishes. Further cultivating these forms into a cohesive family of products was a result of designers and engineers working in tandem. Incorporating features such as magnetic charger mounting and interchangeable plastic components provides the user with the flexibility to create a site specific solution while reducing tooling costs. But the job didn't end there. Bringing the products to market, on time, required **close supervision of the transition into production**, at times requiring daily, concise communications with overseas vendors. The final result is a product line that ensures Revolabs superiority in the enterprise conferencing market.

"Can you hear me now?"
