

The unique function that takes it above and beyond all other emergency lighting on the market now is its ability to show people the correct way out of a building. There are red and green LED's on each side of the product that is pre-programmed when it is installed to work with all the other products installed. When one enters a hallway and is unfamiliar with where the exit is, they can look at the LED's and follow the green lights to the exit. This assures that victims and firefighters are able to successfully navigate throughout a building in which they are not familiar with and safely exit. The two pictures on the right demonstrate how it would look in a hallway with the top one showing the green lights pointing in the direction of the exit and the bottom picture showing the red lights. It is innovations like this that are needed to update this area of products and to save lives.
