

Final-after filler primer coating

I used foam as the material, and use band-saw, spindle sander to make the basic shape. Then use dremel and sand paper 100-400 to refine the shape. Then I used dremel to drill a hole, and put three 1/16" dia magnets inside. I used bondo to seal the hole.

After that I use sand paper 400 and water to sand the foam. Then I used filler primer to make the surface smooth.

I used about 10 layers of filler primer to make the surface perfectly smooth.
