

CONTEXTUAL LAYERS OF INTERACTION

Little Plus is a smart device operation platform designed to accompany Thermostats, Security Systems, Washing Machines and Dishwashers.

Little plus provides contextual interactions which form layers of control for appliances. It monitors the maintenance of the appliance and provides diagnostic information on energy consumption, running costs and any maintenance related issues. It provides information about the issue including severity of the issue, and an estimated cost of repair. It can also provide instructions for fixing the problem.

Using Near Field Communication (NFC) the appliance registers with a smart device running the Little Plus Application. Little Plus opens the appropriate digital interface for each appliance and data is transferred via WiFi from the smart device to the appliance and vice versa. Each of the user interfaces is contextually accurate to the appliance providing lucid understanding and thus coherence with the appliance.

Little Plus does not eliminate the existing controls for each appliance but rather accompanies the existing controls.

Therefore appliances do not lose any of their individual functions and keep their unique selling points.
