

The two heating elements will be **seperate** components that can act as crumb tray's.

Problem

- 1.) Who's idea was it to have all of these cords? They often get tangled and can be very unappealing
- 2.) Metal is not the safest material to use with heat when human contact is being made with the product
- 3.) Part of the toaster is non accessible, making the toaster hard to clean

The Idea

To maintain an overall physical appeal with all ages. letting the user relate to the normal functioning of a toaster, but personifying the toaster in a modern environment. The toaster is made so children can use it with little risk.
