## Sustainable Dehumidifier with biomimicry considerations

### design brief;

Create a project which serves as a solution to an existing product's problem with sustainability. Whether this product is not sustainable because of material choice, production methods, or energy consumption, through research find and explore possible means to make an existing product or process more "green".

### pick a product;

The dehumidifier is a consumer product with many sustainability issues - energy consumption, waster grey-water potential, design aesthetics, and use of hazardous materials. I began my research with other dehumidification methods that could add to the health and air monitoring of ones home hoping to find a more appropriate solution.
