

The building is adaptable in terms of spatial design and allows the use of spaces to become adapted to specific needs. Because of the flexibility in activities involved, the building relates to this identity through the spaces that can be arranged to accomodate specific uses.

A relatively rigid structural system relates identically to car design where a car requires an automotive platform tooperate. The building has a designed structural system that enables spaces to adapt without the need to alter the structural system. The envelope of the building becomes a muscular structure that relates to the interior spaces.

In having this structured skeleton for the design centre, the envelope may evolve as time moves on.. The idea follows the notion of upgrading and improving: new envelope skins can replace the present system. with a structural system clearly calculated and optimised thebuilding offers flexibility for future facade and envelopedesign.

STRUCTURAL FRAMEWORK FOR DESIGN CENTRE
