

CPS Components

There are two main parts to the CPS: A wearable suit that consists of removable exterior perforated cones that connect to drainage veins that run down the side of the suit. The bottom half is a wheel with peripheral arms that get attached to the suit and connect the drainage veins from the bottom and top half. When the suit is connected, water has the ability to travel down the veins into the hydro-wheel chamber that is housed within the wheel. Extending from the peripheral arms are two purification spouts that can directly access the hydrowheel chamber.
