

The ethane and CBB react to create an explosion

## The Mold Brings Life...

The way Cypatian life is created and perpetuated is through the consumption of alcohol, making them the only functioning alcoholics in the galaxy.

The Cypatians collect alcohol nutrients (ethane) from fermenting molds on their planet. They walk over the plants and absorb the ethane into their feet. It then travels up the leg and through the muscle tissue until it gets deposited into the combustion chamber. In the chamber the ethane reacts with an excreted hormone called *combustibalis* (CBB), and it creates an explosion that is propelled throughout the body to all of the organs and muscles.

-  Ethane
-  CBB Hormone
