

## ...And so I went to Cyptia

Cyptia is a dark, damp, spongy planet on the other side of our sun. Its geographic makeup is incredibly cavernous, and there are tunnels that extend from the surface all the way to the core. The planet's humid damp climate make it a perfect home to all kinds of mold species varying in every color, shape, and size imaginable. However, one day in Cyptia's history it cultured something with a complexity beyond mold, beginning the dawn of a new species.
