

# Böring Chair

A high-end rotomolded club chair.

## Project Description

Rotational molding is traditionally used in situations where low quantities are produced at low cost. Using the process of rotational molding, the Böring Chair comes to life with its distinct proportions and high-end features.

The sides and cushion supports are rotomolded with hardware molded into the framework, which increases durability. The four rotomolded pieces fit snugly together to form a base in which the cushions can be placed. Once the cushions are in place, the user can relax in style as onlookers admire the bold design of the Böring Chair.
