

Final Design

The final concept ties the previous idea of group interaction affecting the light's brightness to promoting familial bonding. Key hooks are on the outside pieces (which can be replaced by blank pieces for various household sizes), and as keys are hung up when family members come home, the circuit is completed and the light turns on. The light can attach to a front window and be powered by a solar panel, or hang on a wall and be powered through an outlet.

Modularity

Magnetic connection
