

## VACUUM FIXTURE”

The second fixture is machined out of Richlite, the same recycled paper composite that the front face of the case is made from and holds a much stronger suction than the MDF.

This version can cut the interior of 2 front plates (black Richlite), the interior of 2 back plates (teak plank), and the exteriors (second-sided machining) of each, all in the same run.

Each individual vacuum manifold can be adjusted as well.
