

### Solar Energy

Flip phone over to expose a thin film photovoltaic solar backside that adds battery life and if the primary battery is empty, the power created by this film is enough to emit a GPS signal or to make an emergency call. A green LED light will flash on the backside to notify the user that a call, text, or notification has been received.

### Alternative Solar Concepts

Other methods of solar charging were explored including having the entire front face, excluding the touch screen, be a solar panel, and having solar-rechargeable battery packs.
