

Cacti

designed for Vax

The **Cacti** is designed to minimise water and energy usage during the process of washing dishes. Designed for small, urban living spaces it is ideal for users that live alone and do not have the capacity to fill a dishwasher. That being said the Cacti still has the convenience of a dishwasher but the simplicity of a washing up bowl.

It has been proven that a dishwasher uses less energy and water per plate. A fully loaded dishwasher can use up to 25% less energy than washing that same load by hand. Not to mention the lower water usage and user interaction time.
