

MANDI PROJECT | System design

To upgrade the market and to encourage farmer's role in the current scenario of mandi. new transaction system is proposed that will prevent tax leakages and also help farmer realise the real price of his produce. This will ensure speedy and timely payment to the farmers.

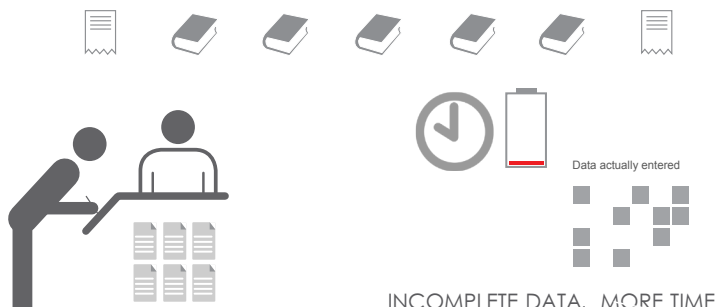

Transaction System

The transaction system in mandi is currently handled manually, where on entry each stakeholder i.e- farmer, buyers and traders are registered at the entrance with certain information and given a pass to do the transaction at different shops, where similar activity i.e. recording the details is repeated multiple times to complete the official document formalities. With transaction card, information is feed on entry, will directly reach to management where the duplicacy and error will be eliminated.

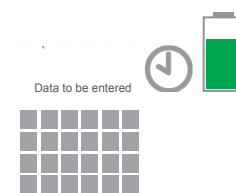

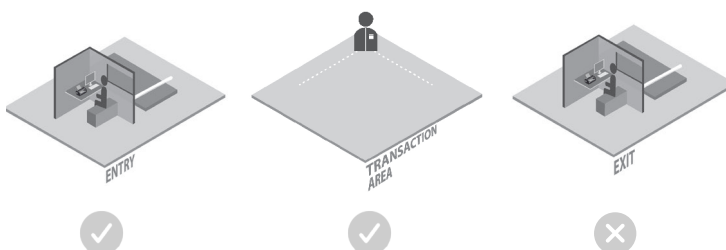

Name of Farmer
Food Commodity name
Food Commodity type } Copied 7 times manually

Farmer's Card } Data on server live

MANUAL BILLS
MORE MAN POWER

LOOP NEVER CLOSED
