

## **SPRINKLER RUST SYSTEMS**

Choosing a well water source for your irrigation system is a fine alternative to relying on the city's water supply. Doing so saves a lot of money. But...it can lead to some problems.

Over time, mineral deposits will inevitably build up within an irrigation system, thanks to drawing from a well water source. What happens after that? Stains – stains everywhere your sprinkler system touches. Grass and plants, along with walls, driveways, sidewalks, even vehicles, suffer when sprayed consistently with water from a mineral-infused irrigation system. If left unchecked, you could be seeing ugly orange iron oxide stains or white hard water stains marring your lawn and property. What can you do? With a sprinkler rust system from Green Lawn Sprinklers Inc., you can easily and automatically prevent these stains from ever occurring, saving you time and money on repairs and repainting.

We prevent rust with a special injection feeder system that pumps a concentrated solution into the irrigation system from a feed tank. This tank runs quietly and reliably alongside the irrigation system. As the solution is fed into the system, it works to dissolve mineral deposits and scaling that builds up inside. The resulting clean water is the only thing that gets sprayed out – the solution stays within the irrigation system, so your grass and plants still get the water they need without being damaged.

Like with all of our systems, Green Lawn Sprinklers Inc. can maintain your rust system for you, with monthly maintenance and solution refills. We can also adjust how much solution is pumped into the irrigation system depending on mineral deposits, for dissolving minerals when you need it and saving on solution when you don't. Lawns aren't supposed to be stained yellow or red or white – they look best when they're green. Call on Green Lawn Sprinklers Inc. today and protect your property from unsightly stains and rust.
