ideation

During the ideation process I went through a series of sketches to find the appropriate design for the household work space. The two strongest ideas were the rechargeable pod tower and the linked light system. By taking these two ideas into Photoshop, I was able to give the drawings a 3D appearance.

Printing off the renderings and adhering them to foam core allowed me to experience the products in more of a three dimensional context. I then determined the appropriate alterations to make to the size and form.
