

How it works

The **MOTOR** inside it's container generates the suction through the manifold coming from the top of the container.

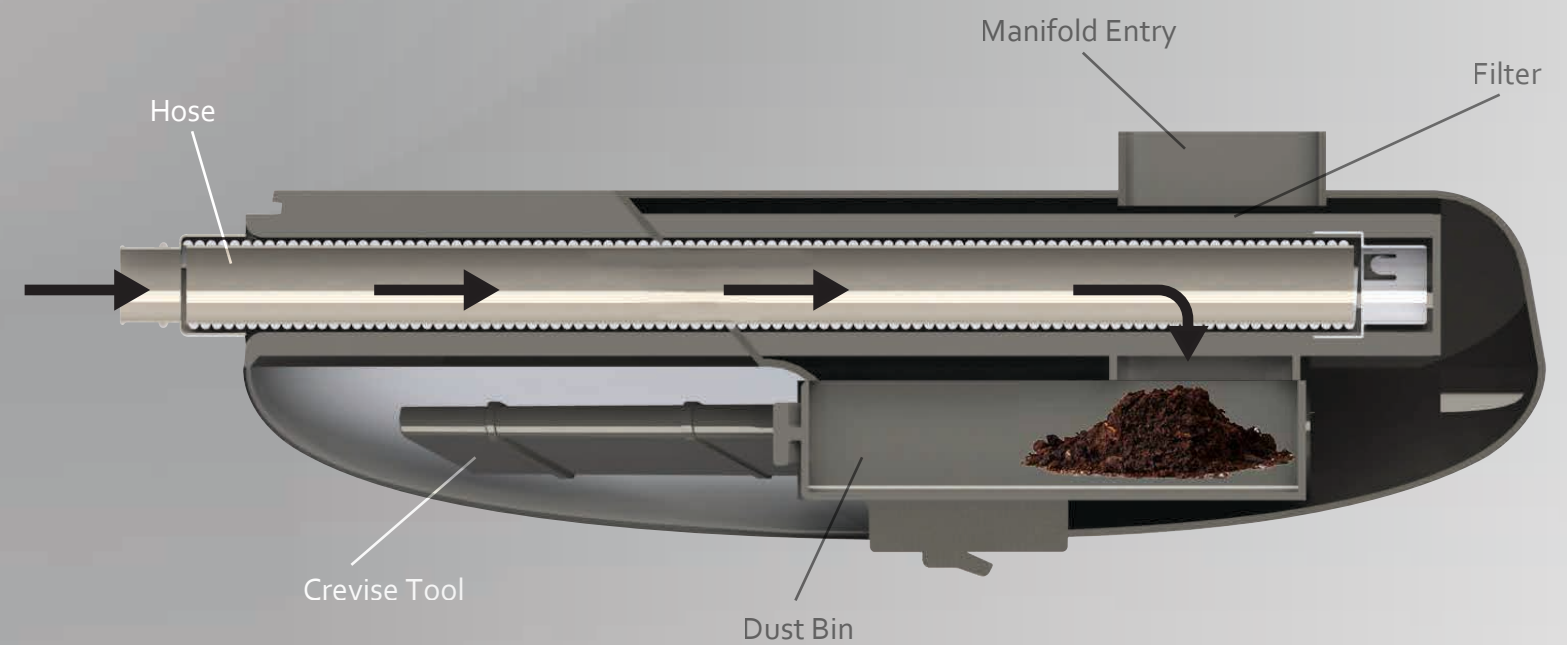

The **MANAFOLD** travels up the side frame of the vehicle and connects to the main vacuum system on the ceiling.

Manifold shape

The main **VACUUM SYSTEM** stores all the essentials needed for this vacuum to function as a regular vacuum.

Cut section view of the mechanics of the vacuum system. The dirt path goes through the hose and down into the dust bin, while getting its suction from the manifold.

Hose placement is located in the center. The vacuum when turned on can suck the hose back to it's resting position; making it easy to store away.

Hose Length: 18" (stretches to 90")
Hose Diameter: 1 1/4"
