

To encourage parallel learning, this scheme introduces several different fields in the same space, each articulated by a unique material. The visitor acts as the source for each field type, activating the thermal sensors in vertical SmartSlab panels and the magnetic floor system comprised of aluminum cans. A third, perhaps less evident field is created by translucent wall panels made of horizontally-stacked drinking straws. The straws and the cans create visual fields by introducing familiar objects in unusual compositions, thus making the ordinary extraordinary. The spatial configuration and the individual material panels are based on a standard two foot by two foot grid, referencing the Phoebe's Field narrative.
