

PLANT ME!

People aren't the only ones that need a home! Hundreds of animals live in the Los Angeles National Forest and they need more homes! That's why we need to plant more trees. More than 62,000,000 trees were cut down in 2000 to 2009 just in the US! And Billions more are cut down world wide! With forests shrinking we need to do our part to keep our wilderness green for us and for animals!

Birds, Raccoons, Squirrels and Foxes are only handful of the different types of animals that live in California. Help us keep California green so they can have a good home and we can continue living in a beautiful state!

A bird's heart beats **400** times per minute while resting and up to 1000 beats per minute while flying.

Sometimes groups of ground squirrels work together to warn each other of approaching danger with stling call.

The are **18** different speices of owls in North America. And not all owls are nocturnal!

Raccoons may inhabit a tree hole, fallen log, or a house's attic. The young raccoons often spend the first two months or so of their lives high in a tree hole.

Forests are disappearing all over the world!

Forests help clean our air and give many animals homes! Deforestation is a huge problem and is a leading reason for the extinction of hundreds of our favorite animals and birds! You and your family can help us by planting this seed packet at home, volunteering to plant trees and/or donating to **TREEPEOPLE**.

TREEPEOPLE
<http://www.treepeople.org/>

Like a cat's, the fox's thick tail aids its balance, but it has other uses as well. A fox uses its tail (or "brush") as a warm cover in cold weather and as a signal flag to communicate with other foxes.
