Follicular Unit Excision

(FUE) surgery was introduced to the world by the founder of NHI Medical, Dr. William Rassman, in 2002. FUE harvesting gives you the option of keeping your hair very short as there is no scarring. With this technique, individual hair follicles are harvested directly from the donor area without the traditional linear incision in the back of the scalp. Rather than a scalpel, we use specialized cylindrical punches that allow us to core out the hair follicle from the donor area one at a time. Dr. Rassm and Dr. Pak hold numerous U.S. Patents for FUE harvesting making us the world's expert in FUE technology.

Hairline Lowering/Forehead Reduction Surgery

lowers your hairline to better frame your face. This can be achieved using individual hair follicles to completely redesign your hairline with a hair transplant, or we can advance your hairline directly forward by a surgical procedure. The doctors of NHI Medical can advise you as to which procedure would best meet the goals you are trying to achieve.

Eyebrow Transplant Surgery

involves harvesting the donor hair from the back of your scalp and dissecting it under a stereomicroscope into individual single hair follicles. These individual hair follicles are artistically placed to create your perfect eyebrows.

Scalp Micropigmentation

(SMP) was introduced to the hair medical and surgical community by doctors at NHI Medical in 2009. SMP is a cosmetic, medical grade tattoo that gives the appearance of hair stubble or can provide the illusion of denser, thicker hair. The procedure can create amazing results for a bald person as well as people with thinning hair who desire a fuller looking head of hair. NHI Medical doctors have published numerous medical articles pertaining to SMP.

Follicular Unit Transplant

or Strip Surgery (FUT) is a technique pioneered by the NHI Medical physicians. Donor hair follicles are harvested with a linear incision in the back of your head. The incision is hidden or covered by your hair around the donor area. The FUT technique harvests the highest quality of grafts under stereomicroscopic dissection.

Facial Hair/Beard Transplants

can create or thicken facial hair that is sparse, thinning, or missing. Donor hair is taken from the scalp or other parts of your beard below the chin depending on your hair characteristics and density.

contact us.

Meet with the doctors who introduced Scalp MicroPigmentation(SMP) to the world, who invented the immensely popular Follicular Unit Excision (FUE) procedure and who hold over 18 U.S. patents related to the fields of hair transplantation. Contact NHI Medical and schedule a consultation with a doctor today. You can schedule a consultation online at www.newhair.com or by calling (800) 639-4247

visit our monthly open house.

You can schedule a one-on-one personal consultation with an NHI Medical doctor. You may also attend our immensely popular, monthly Open House, where you can view a live hair transplant procedure, meet actual patients, view their results and talk to them about their experience with NHI Medical. You will also have an opportunity to speak briefly with the doctors during an individual private consultation. These events are held monthly in our Los Angeles office and bi-monthly in the Irvine office. To learn more about our Open Houses, schedule a consultation and/or view the upcoming schedule, visit www.newhair.com/open-house, or call us at (800) NEW-HAIR.

our happy clients.

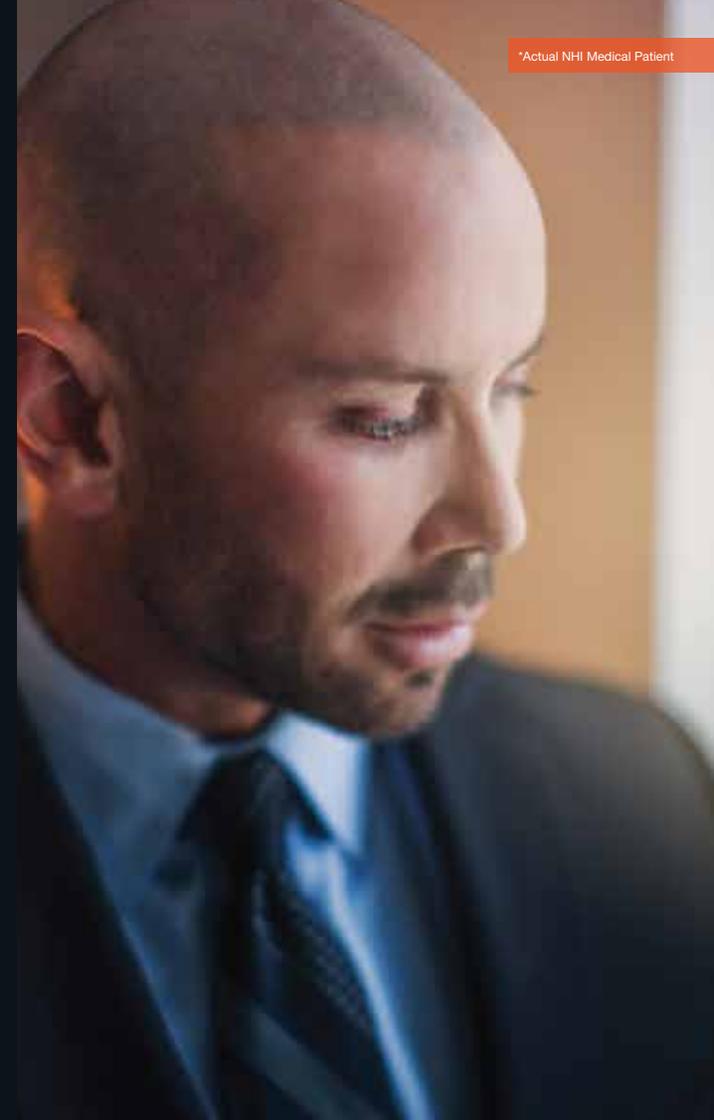

"My receding hairline has been bothering me for years. Dr. Park was so helpful in explaining the procedure and ensure me of the positive outcome. I feel more confident and the feeling of my own natural hair through my fingers is amazing."
